REQUIREMENT BASELINE DOCUMENT

Multi-Vendor E-Commerce Platform

Project 261002 – Euro Infotech

Document Field	Details
Customer	Euro Infotech
Customer Representative	Azaz – Owner
Prepared By	NEXTB PRIVATE LIMITED
Document Type	Business and Software Requirement Baseline
Baseline Version	1.0
Baseline Date	10 October 2026
Status	Prepared for review and approval
Reference	Customer requirements and approved project discussions

This document records the agreed requirements against which design, development, testing, acceptance and change requests will be assessed.

Document Control

Purpose

This Requirement Baseline Document defines the functional and non-functional scope of the Euro Infotech multi-vendor e-commerce platform. It establishes a common reference for the customer, NEXTB, development team and testing team. Requirements marked as baseline form the agreed development scope. Any later addition, removal or material change will follow the change-control process in this document.

Revision History

Version	Date	Prepared By	Description
1.0	10 October 2026	NEXTB PRIVATE LIMITED	Initial requirement baseline based on the customer requirement set.

Approvals

Role	Name / Organisation	Approval	Date
Customer Owner	Azaz / Euro Infotech	_____	_____
Solution Provider	NEXTB PRIVATE LIMITED	_____	_____
Project Representative	_____	_____	_____

Requirement Status Definitions

Status	Meaning
Baseline	Approved requirement included in the committed scope.
Configurable	Included capability whose final business values or rules will be provided during implementation.
Dependency	Requires a customer account, third-party approval, credential, API or commercial plan.
Future Phase	Recorded for roadmap planning and excluded from the MVP unless separately approved.
To Be Confirmed (TBC)	A business choice must be confirmed before the affected feature can be accepted.

Interpretation Rules

- “Platform” means the Euro Infotech customer website, vendor panel, admin panel, backend services and databases described here.
- “Vendor” and “seller” refer to a third-party merchant registered on the platform.
- “Admin” means an authorised Euro Infotech or NEXTB operational user with assigned permissions.
- Money, tax, shipping, commission and refund calculations will use server-side rules. Values shown in examples are illustrative unless explicitly approved as business rules.

1. Project Overview

1.1 Business Objective

Euro Infotech requires a mobile-first multi-vendor e-commerce platform where customers can discover and purchase products from multiple approved vendors, vendors can manage their own catalogue and fulfilment, and administrators can control marketplace operations. The platform must support vendor-wise orders, commission calculation, payment and shipping workflows, returns and payouts.

1.2 Stakeholders

Stakeholder	Primary Responsibility
Customer / Buyer	Registration, discovery, purchase, payment, tracking, cancellation, returns, reviews and support.
Vendor / Seller	KYC, store and product management, inventory, order fulfilment, returns, earnings and payout details.
Administrator	Approvals, moderation, configuration, operations, finance controls, reporting and access management.
Support / Operations	Customer and vendor assistance, issue tracking and permitted operational actions.
NEXTB Development Team	Implementation, testing, documented deployment and maintenance within the approved scope.
Third-Party Providers	Payment, OTP/email, shipping, storage or other connected services selected for the project.

1.3 Business Outcomes

- Provide one storefront for products offered by multiple approved vendors.
- Split a customer order into vendor-specific sub-orders for fulfilment, cancellation, return, commission and payout processing.
- Give the administrator complete operational visibility and permission-controlled control.
- Record financial events clearly so commission, vendor earnings, refunds and payouts can be reconciled.
- Establish a stable MVP that can later support advanced marketing, loyalty, subscriptions and mobile applications.

1.4 Success Criteria

- A customer can complete a valid order containing products from one or more vendors.
- Each vendor can access only its own store, products, inventory, orders, returns and earnings.
- Admin users can approve and manage vendors, products, orders, commissions, returns and payouts according to permissions.
- Payment and shipping status changes are traceable, repeat-safe and visible to authorised users.
- All mandatory MVP acceptance criteria in this document pass in the agreed test environment.

2. Scope Baseline

2.1 MVP Scope

Area	Included MVP Capability
Customer	Registration/login; product catalogue; category navigation; normal search and filters; product details; cart; buy now; addresses; checkout; online payment/COD; order status; cancellation; return/refund request; ratings/reviews; basic notifications and support access.
Vendor	Registration; KYC submission; admin approval; store profile; products and variants; inventory; pricing/discounts; orders; shipping details; returns/refunds; commission, earnings, payout and basic sales reports.
Admin	Dashboard; customer/vendor/product/category/order/payment/commission/coupon/banner/return/refund/payout/review management; reports; settings; CMS; roles and permissions.
Commerce Core	Parent order and vendor sub-orders; inventory reservation; pricing; discount allocation; payment states; shipment states; commission calculation; vendor earnings and payout records.
Quality and Security	Responsive interface, access control, validation, audit trail for sensitive actions, backup planning, secure authentication and required functional testing.

2.2 Future-Phase Scope

Capability	Baseline Treatment
Advanced AI recommendations and personalisation	Future phase after catalogue quality and usage data are available.
Customer wallet, loyalty points and subscriptions	Future phase requiring separate business and accounting rules.
Referral programme and advanced growth automation	Future phase; basic coupons and offers may be included in MVP.
Advanced analytics and forecasting	Future phase beyond the basic reports defined here.
Android, iOS and vendor mobile applications	Future channel; backend should remain suitable for later API clients.
Automated vendor bank transfers	Future integration unless provider and payout workflow are separately approved.

2.3 General Exclusions

- Marketplace inventory procurement, warehousing and physical fulfilment performed by NEXTB.
- Fees charged by payment gateways, shipping providers, SMS/OTP providers, email services, domains, hosting or app stores unless included in a separate commercial document.
- Vendor tax, legal or KYC verification performed outside the data and workflow supported by the platform.
- Guaranteed search ranking, sales volume, payment-provider approval or courier coverage.
- Features not stated in this baseline or later accepted through written change control.

3. Customer-Side Requirements

ID	Requirement	Baseline Description	Status
CUS-001	Account Registration	Customer can register using approved identity fields. Duplicate account handling and consent are enforced.	MVP
CUS-002	Login	Support email/password and mobile OTP login when providers are configured. Sessions and logout are supported.	MVP / Dependency
CUS-003	Profile	Customer can view and update permitted profile information.	MVP
CUS-004	Addresses	Customer can add, edit, select and remove multiple delivery addresses.	MVP
CUS-005	Category Navigation	Browse active categories, subcategories and product listings.	MVP
CUS-006	Normal Search	Search active products and apply relevant category, price, vendor, availability, rating and variant filters.	MVP
CUS-007	AI Search	Accept natural-language search and convert it into safe catalogue retrieval with normal-search fallback.	Configurable
CUS-008	Product Details	Show title, description, price, discounts, variants, stock status, images, approved videos, vendor, delivery information and reviews.	MVP
CUS-009	Wishlist	Add/remove products and view the signed-in customer wishlist.	MVP
CUS-010	Cart	Add products/variants, update quantity, remove items and view server-calculated totals.	MVP
CUS-011	Buy Now	Proceed directly with one selected product/variant through the normal checkout validations.	MVP
CUS-012	Coupons and Offers	Apply eligible coupons/discounts and show reasons for invalid or ineligible codes.	MVP
CUS-013	Checkout	Validate address, stock, price, discount, shipping and payment method before order creation.	MVP
CUS-014	Payments	Support configured online methods and COD; display pending, successful and failed outcomes accurately.	MVP / Dependency
CUS-015	Orders	Show one customer order with vendor-wise items, amounts, status and shipment information.	MVP
CUS-016	Tracking	Show shipment/AWB information and status updates received from the shipping workflow.	MVP / Dependency
CUS-017	Cancellation	Allow eligible item/sub-order cancellation according to status and configured policy.	MVP
CUS-018	Returns and Refunds	Submit eligible return/refund requests with reason and evidence; view request and refund status.	MVP
CUS-019	Ratings and Reviews	Eligible customers can submit ratings/reviews; moderation and one-review rules apply.	MVP
CUS-020	Notifications	Receive defined order, payment, shipping, cancellation, return and refund notifications through enabled channels.	MVP / Dependency
CUS-021	Support	Access configured support details and submit a support request or query.	MVP

4. Vendor/Seller Requirements

ID	Requirement	Baseline Description	Status
VEN-001	Registration	Vendor can create an application and provide required business/contact details.	MVP
VEN-002	KYC	Submit required KYC fields and private documents; view approval or correction status.	MVP

ID	Requirement	Baseline Description	Status
VEN-003	Approval	Vendor access to selling capabilities begins only after admin approval.	MVP
VEN-004	Store Profile	Manage permitted store name, description, logo, address, contact and policy information.	MVP
VEN-005	Products	Create, edit, archive/delete and submit products for approval.	MVP
VEN-006	Variants	Manage size, colour or other configured options, SKUs, prices and media.	MVP
VEN-007	Inventory	View and adjust available stock; reserved/committed stock remains system-controlled.	MVP
VEN-008	AI Product Entry	Generate a structured draft from vendor input; vendor reviews it before submission. AI cannot publish directly.	Configurable
VEN-009	Price and Discount	Manage permitted price, sale price and discount schedules, subject to validation and approval rules.	MVP
VEN-010	Order Management	View only own sub-orders and process accepted operational actions.	MVP
VEN-011	Shipping	Enter or receive package, courier, AWB and tracking details according to the selected shipping model.	MVP / Dependency
VEN-012	Returns and Refunds	Review assigned requests, provide evidence and perform authorised workflow actions.	MVP
VEN-013	Reports	View basic sales, order, return and settlement summaries for own store.	MVP
VEN-014	Commission	View applied commission rule and amount for own order lines/sub-orders.	MVP
VEN-015	Earnings / Wallet	View pending, on-hold, available, paid and adjusted earnings. This is a ledger view, not a customer payment wallet.	MVP
VEN-016	Payout Details	Maintain approved bank/payout details through a controlled and auditable process.	MVP
VEN-017	Payouts	View payout requests or statements, payment reference and status.	MVP
VEN-018	Notifications	Receive approval, product, inventory, order, return and payout notifications through enabled channels.	MVP / Dependency
VEN-019	Isolation	A vendor cannot read or modify another vendor’s private data.	Mandatory

5. Admin Requirements

ID	Requirement	Baseline Description	Status
ADM-001	Dashboard	Display configured operational KPIs and items requiring attention.	MVP
ADM-002	Customers	Search, view, update permitted status and review customer activity.	MVP
ADM-003	Vendors	Review, approve, reject, suspend and manage vendor applications and profiles.	MVP
ADM-004	Products	Approve, reject, request correction, unpublish and moderate vendor products.	MVP
ADM-005	Categories	Create and maintain category/subcategory hierarchy, attributes and status.	MVP
ADM-006	Orders	View parent orders and vendor sub-orders; perform permission-controlled operational actions.	MVP
ADM-007	Payments	View payment attempts, verification and reconciliation states; initiate authorised refunds.	MVP
ADM-008	Commission	Configure percentage or fixed rules with scope and effective dates; view applied calculations.	MVP
ADM-009	Coupons	Create and control coupon eligibility, validity, usage limits and funding rules.	MVP
ADM-010	Banners	Create, order, schedule and deactivate storefront promotional banners.	MVP

ID	Requirement	Baseline Description	Status
ADM-011	Returns / Refunds	Review requests, record decisions, coordinate pickup and initiate/track refunds.	MVP
ADM-012	Vendor Payouts	Review eligible balances, approve/record payouts, references, failures and adjustments.	MVP
ADM-013	Reviews	Publish, hide or reject reviews under moderation rules with reason.	MVP
ADM-014	Reports	View/export basic sales, orders, commission, refunds, vendors and payouts reports.	MVP
ADM-015	Settings	Manage permitted marketplace, contact, order, commission and integration settings.	MVP
ADM-016	CMS	Manage About, Terms, Privacy, Return Policy and other configured content pages.	MVP
ADM-017	Roles / Permissions	Create roles and assign fine-grained permissions; sensitive actions remain restricted.	MVP
ADM-018	Audit Logs	View recorded sensitive administrative and financial actions.	MVP
ADM-019	Notifications	Receive operational alerts for configured exception and approval events.	MVP

6. Commerce and Order Requirements

6.1 Multi-Vendor Order Structure

A checkout creates one customer-facing parent order and one vendor sub-order for each participating vendor. Items, quantities, discounts, shipping, tax, commission, cancellation, returns, refunds and payouts must remain traceable at the appropriate item or vendor sub-order level.

ID	Requirement
ORD-001	Create a parent order containing the full customer purchase and totals.
ORD-002	Create vendor-specific sub-orders and provide only the relevant sub-order to each vendor.
ORD-003	Snapshot product, SKU, price, tax and allocation data used at checkout so later catalogue changes do not alter historical orders.
ORD-004	Reserve or atomically verify stock before confirming an order; prevent overselling under concurrent checkout.
ORD-005	Track customer, payment, fulfilment, shipment, cancellation, return and refund states separately.
ORD-006	Support item quantity and sub-order level cancellations and returns when allowed.
ORD-007	Recalculate refundable amounts from recorded allocations and processed quantities.
ORD-008	Keep a time-stamped history of order status changes and the actor/source responsible.

6.2 Commission and Earnings

Commission may be configured as a percentage or fixed amount, with documented scope and effective dates. For example, on a product value of ₹1,000, a configured commission of ₹100 results in ₹900 gross vendor share before applicable shipping, tax, refund or other approved adjustments. The example does not establish a universal 10% rate.

ID	Requirement
COM-001	Store the commission rule applied to each order item or vendor sub-order.
COM-002	Show product amount, discount allocation, tax, shipping, commission, refund/adjustment and vendor net amount separately.
COM-003	Prevent the same eligible earning from being paid twice.

ID	Requirement
COM-004	Place earnings on hold until the configured delivery/return conditions are satisfied.
COM-005	Post explicit adjustments when a refund or reversal occurs after payout.
COM-006	Provide admin and vendor statements that reconcile to recorded order and payout events.

6.3 Order Status Principle

- Customer status is a readable summary of underlying payment and fulfilment state.
- Vendor actions are limited to the vendor sub-order and permitted state transitions.
- Admin overrides require permission, reason and audit entry.

7. Payment, Shipping and Return Requirements

7.1 Payments

ID	Requirement
PAY-001	Integrate the selected payment gateway for enabled UPI, card, net banking and wallet methods. Available methods depend on the provider account.
PAY-002	Support Cash on Delivery where the order, product, amount and serviceable location are eligible.
PAY-003	Verify payment results on the server and process signed gateway callbacks/webhooks.
PAY-004	Handle duplicate, delayed and out-of-order payment notifications without duplicate orders, captures or ledger effects.
PAY-005	Record failed, pending, successful, refunded and partially refunded outcomes.
PAY-006	Support full and partial refund requests and provider reconciliation.
PAY-007	Do not store raw card credentials or security codes in the platform.

7.2 Shipping

ID	Requirement
SHP-001	Calculate shipping charges using the approved business model and vendor origin where relevant.
SHP-002	Check pincode serviceability when the selected shipping provider supports it.
SHP-003	Support vendor-wise packages, shipping details and shipment state.
SHP-004	Connect to selected shipping partner APIs after credentials, plan and service coverage are provided.
SHP-005	Store AWB/tracking number, courier and tracking link/status.
SHP-006	Receive or retrieve shipment updates safely and retain status history.
SHP-007	Support return pickup workflow where the selected provider and return policy allow it.

7.3 Cancellation, Return and Refund Rules

- Eligibility will be evaluated per item/quantity using the approved status, time window, reason, product category and policy rules.
- Requests store customer reason, evidence where required, decision, actor, timestamps and linked shipment/refund records.

- A return approval and a refund success are separate states. The customer sees the current state and available reference.
- Refund allocation must preserve the original distribution of product value, discount, tax, shipping and other approved charges.
- Final cancellation, return window, non-returnable categories and charge-allocation rules are business inputs to be confirmed before acceptance testing.

8. Catalogue, Search, Content and Marketing

8.1 Catalogue and Media

ID	Requirement
CAT-001	Products belong to an active category and vendor and pass required validation.
CAT-002	Variants support configured attributes such as size and colour, each with a unique vendor SKU where required.
CAT-003	Inventory is tracked at the sellable variant level.
CAT-004	Product media supports ordered images and approved video links/files within configured limits.
CAT-005	Admin approval or moderation applies before vendor products become publicly available.
CAT-006	Archived or rejected products remain absent from customer purchase flows.

8.2 Search and AI

ID	Requirement
SEA-001	Normal product search and filters remain available independently of AI.
SEA-002	Search results include only active, approved, visible products and respect stock/availability rules.
SEA-003	AI search may interpret natural language into validated search terms and filters; it cannot invent products, prices or availability.
SEA-004	AI product entry creates an editable draft. Vendor review and normal approval remain mandatory.
SEA-005	AI failure, timeout or disabled configuration falls back to normal workflows with a clear user message.

8.3 SEO and Marketing

- Use readable and stable product/category URLs, page titles, descriptions and canonical links.
- Provide sitemap, robots configuration and product structured data for eligible public pages.
- Use responsive pages and appropriately optimised media for reasonable loading performance.
- Support category/product landing pages, social sharing, coupons, offers and flash-sale configuration where included.
- Referral, loyalty and subscription programmes remain future-phase capabilities unless separately baselined.

8.4 CMS

- Admin can manage About, Terms and Conditions, Privacy Policy, Shipping Policy, Return/Refund Policy and agreed informational pages.
- Legal and policy content is supplied and approved by the customer. The platform records and displays it; NEXTB is not the author of customer legal policy unless separately agreed.

9. Non-Functional Requirements

ID	Area	Baseline Requirement
NFR-001	Responsive Design	Customer, vendor and admin interfaces must support current desktop and mobile browser layouts appropriate to their workflows.
NFR-002	Transport Security	Production traffic uses HTTPS through the deployment platform and configured domain.
NFR-003	Authentication	Passwords are securely hashed; OTPs are time-bound and protected from abuse; sessions can be revoked.
NFR-004	Access Control	Role- and permission-based checks apply on the server. Admin 2FA is required when enabled for production.
NFR-005	API Security	Authenticated APIs enforce identity, authorisation, input validation and request limits where required.
NFR-006	Application Security	Inputs and outputs are validated; database access uses safe parameterised/ORM operations; customer-supplied content is escaped or sanitised.
NFR-007	Financial Safety	Checkout totals, commission, refunds and payouts are calculated server-side and use repeat-safe processing.
NFR-008	Auditability	Sensitive admin, vendor approval and financial actions record actor, action, target, outcome and time.
NFR-009	Privacy	Private customer, KYC and financial data is visible only to authorised roles and is excluded from public responses and logs.
NFR-010	Reliability	Payment callbacks and background operations tolerate duplicate delivery and can be retried without duplicating business effects.
NFR-011	Backup / Recovery	Production database and required object data follow an agreed backup and restore process tested before launch.
NFR-012	Monitoring	Health, errors and critical workflow failures are visible to authorised operators without exposing secrets.
NFR-013	Performance	Acceptance performance will be measured against an agreed catalogue and traffic fixture in the target environment.
NFR-014	Compatibility	Support current stable versions of major browsers agreed for launch.
NFR-015	Maintainability	Code, migrations, configuration and operational instructions remain version-controlled and documented.

Baseline Performance Targets

- Ordinary pages and API responses should remain usable under the agreed MVP test data and target environment.
- Image and video delivery should use suitable sizing, formats and caching.
- Third-party latency is measured separately from platform processing and cannot be guaranteed by NEXTB.
- Final response-time, concurrency, availability, RPO and RTO targets require hosting and business-volume confirmation before production acceptance.

10. Data, Roles and Reporting

10.1 Core Data Groups

Data Group	Examples	Ownership / Access
Identity	Customer, vendor staff, admin account, role, session	User and platform; restricted by role and purpose.
Vendor	Application, KYC, store, bank profile	Vendor and authorised admins; KYC remains private.

Data Group	Examples	Ownership / Access
Catalogue	Category, product, variant, media, inventory	Vendor-owned records subject to platform moderation.
Commerce	Cart, coupon, order, sub-order, order item, allocations	Customer/vendor/admin views scoped to permitted records.
Payment / Shipping	Attempts, callbacks, refund, shipment, AWB, tracking	Authorised operations and finance access.
Finance	Commission rule, earnings, ledger, payout, adjustment	Vendor-own view; privileged admin control.
Content / Support	CMS page, banner, notification, ticket, review	Role-scoped; public content only after approval.
Audit	Actor, action, target, before/after reference, time	Restricted admin/compliance access.

10.2 Role Principles

- Customer users access only their own account, addresses, wishlist, cart, orders, returns and support records.
- Vendor users access only their assigned vendor and permitted store functions.
- Admin permissions are assigned by role; access to finance, KYC, refunds, payouts and role management can be separated.
- Public users access only published catalogue and CMS data intended for public display.
- A user interface restriction alone is insufficient; the server must enforce each permission.

10.3 Basic Reports

Audience	Required Reports / Views
Vendor	Orders, sales, returns/refunds, commission, available/on-hold/paid earnings and payout statements.
Admin	Sales, orders, payments, COD, vendors, products, inventory exceptions, cancellations, returns/refunds, commission and payouts.
Customer	Order invoices/summary, payment/refund status and shipment history where applicable.

Export fields, date ranges, tax invoice format and financial report ownership will be finalised with the customer before report acceptance.

11. Integrations, Dependencies and Assumptions

11.1 Integration Dependencies

Integration	Customer / Provider Input Required	Effect if Unavailable
Payment Gateway	Approved merchant account, credentials, enabled methods, webhook setup and refund permissions.	Online payment/refund validation remains blocked; COD can be tested independently.
OTP / Email	Approved sender/account, templates, credentials, limits and production consent.	Use configured development mode; real OTP/email acceptance remains blocked.
Shipping Partner	Account, API credentials, service coverage, origins, packaging and billing rules.	Manual shipment flow may be tested; live serviceability/tracking remains blocked.
Object / Media Storage	Production storage account, access rules, allowed formats and limits.	Production media persistence cannot be accepted.
AI Provider	Provider choice, key, budget, usage policy and approved data	AI features stay disabled; normal

Integration	Customer / Provider Input Required	Effect if Unavailable
	handling.	search/product entry continues.
Domain / Hosting	Domain control, hosting/deployment account and production secrets.	Production publication and domain validation remain blocked.

11.2 Assumptions

- Euro Infotech will provide final branding, contact details, policies, tax and invoice requirements, commission rules and authorised admin users.
- The customer has authority to use all supplied product content, images, videos, trademarks and vendor/customer data.
- Selected providers expose suitable APIs and approve the customer account. Provider limitations take precedence over requested channels.
- Development and test data will be synthetic or appropriately authorised. Production credentials will be stored in the deployment secret manager.
- The agreed MVP is delivered in reviewable modules and accepted against the baseline criteria.

11.3 Business Decisions to Confirm

Decision	Required Before
Seller/invoice model and GST responsibility	Pricing and checkout acceptance
Commission basis, fixed charge unit and effective dates	Commission implementation
Coupon funding and discount allocation	Coupon and refund acceptance
Shipping charge ownership and vendor-origin model	Shipping implementation
COD eligibility and settlement treatment	COD acceptance
Cancellation/return windows, reasons and non-returnable categories	Return acceptance
Refund treatment of shipping, tax, discounts and gateway charges	Refund acceptance
Payout hold period, minimum balance, approval and bank-verification process	Payout acceptance
KYC fields, required documents and reviewer roles	Vendor onboarding acceptance
Notification channels, templates and sender identities	Production notification acceptance

12. Acceptance and Testing Baseline

12.1 General Acceptance Conditions

1. Requirement is implemented in the agreed test environment and is accessible to the correct role.
2. Positive, validation, authorisation and relevant failure cases pass.
3. No unresolved critical or high-severity defect affects the acceptance scenario.
4. Applicable migrations, configuration and operating instructions are documented.
5. Third-party dependent scenarios use approved sandbox/test accounts; any blocked live-provider validation is recorded explicitly.
6. The customer reviews the agreed demonstration/UAT evidence and records acceptance or defects within the agreed review window.

12.2 Mandatory End-to-End Scenarios

Scenario	Expected Baseline Outcome
Customer identity and access	Registration/login works; invalid or expired credentials/OTP fail safely; private areas require authentication.
Vendor onboarding	Vendor submits KYC; admin approves; unapproved vendor cannot publish or fulfil orders.
Catalogue and stock	Approved product with variants becomes searchable; invalid SKU/price/stock is rejected; unavailable stock cannot be purchased.
Multi-vendor checkout	One cart with multiple vendors creates one customer order and the correct vendor sub-orders and allocations.
Online payment	Successful payment confirms once; failed/pending/duplicate callbacks produce the correct non-duplicated result.
COD order	Eligible COD order is created and follows its own payment/fulfilment states.
Vendor fulfilment	Each vendor sees and processes only its sub-order; customer sees combined order progress.
Cancellation and return	Eligible quantity can be cancelled/returned; ineligible action is blocked with reason; status history remains visible.
Partial refund	Correct amount and allocation are recorded; duplicate provider notifications do not duplicate refund effects.
Commission and payout	Applied rule, vendor net, hold, available and paid amounts reconcile; same earning cannot be paid twice.
Permissions and isolation	Customer/vendor/admin cross-access attempts fail; sensitive admin actions require the correct permission.
Operational recovery	Health checks, backup procedure and agreed restore evidence are available before launch.

12.3 Defect Severity

Severity	Meaning
Critical	Security breach, data loss/corruption, incorrect financial effect, complete service outage or no safe workaround.
High	Core MVP workflow unusable or materially incorrect with no reasonable workaround.
Medium	Feature works partially or has a reasonable workaround; does not compromise security or financial correctness.
Low	Minor visual, wording or convenience issue without material workflow impact.

13. Delivery, Baseline and Change Control

13.1 Development and Source-Control Rule

Each feature, bug fix or other scoped change is developed on a dedicated GitHub task branch. The work is completed and tested on that branch. A pull request is merged into main only after required checks and repository rules pass. The resulting main commit is verified and recorded in the delivery report.

13.2 Baseline Control

- Version 1.0 becomes the reference baseline when approved by the customer and NEXTB.
- Clarifications that do not alter scope may be recorded as notes or acceptance detail.

- A requested feature, changed business rule, new integration, changed acceptance condition or material redesign after approval is evaluated as a change request.

13.3 Change Request Process

7. Requester records the proposed change, reason, affected requirement and desired priority.
8. NEXTB evaluates functional impact, technical impact, data/migration impact, testing effort, dependency, schedule and commercial impact.
9. Customer and NEXTB approve, reject or defer the change in writing.
10. Approved change receives an identifier, updated requirement status and planned delivery module.
11. The baseline document or traceability record is revised and versioned when the change affects agreed scope.

13.4 Traceability

Requirement identifiers in this document should be referenced in development tasks, test cases, defects and acceptance records. This allows each delivered capability to be traced from requirement through implementation and verification.

13.5 Baseline Approval Statement

By approving this document, the parties confirm that it accurately records the required platform scope at baseline version 1.0. Approval authorises design and development against these requirements. Commercial terms, ownership, warranty, support, hosting charges and payment schedules remain governed by the applicable quotation, proposal, work order or agreement.
